PORTFOLIO

Projects

Selected projects demonstrating my practical development skills and problem-solving approach.

Future Care Network · CSC6200 · UniSQ 2026

PROJECT 03

Future Care Network

A full-stack childcare matching platform built as part of CSC6200 Advanced ICT Professional Project at the University of Southern Queensland, Trimester 1 2026. The client was Angela Cochrane, representing Future Care Network a regional childcare initiative connecting families with qualified educators across rural and regional Australia.

The core problem: families in regional Australia rely on unregulated Facebook groups with 50,000+ members to find childcare, while educators face $10,000 startup costs with no support and no centralised platform to reach families. Our team built an MVP to solve this directly.

My Role

- Contributed to backend development and system architecture using Laravel 11
- Contributed to project documentation, user manual, and sprint planning across 8 weeks
- Supported deployment to Railway cloud hosting and final client

- Family and educator registration with secure login system
- Admin dashboard with live KPI cards and Chart.js data visualisation
- Blue Card compliance tracking for educator verification
- Auto-matching algorithm based on postcode and care type
- Regional demand heatmap by postcode to support government funding applications

Laravel 11 PHP 8.3 MySQL Bootstrap 5 Chart.js JavaScript Agile

PROJECT 01

Restaurant Web Application

PROJECT 02 *Restaurant Web Application · Laravel*

AI Order Automation Concept

Admin Panel Auth System MySQL DB

A systems design concept focused on automating the order management process for restaurant operations. The goal was to reduce manual handling of orders, minimise errors, and improve overall operational efficiency.

This project required researching existing automation technologies, mapping current workflows, and designing a proposed architecture that could integrate with existing POS systems.

Key Design Elements

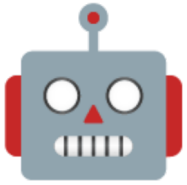
- Automated order routing from customer to kitchen

comprehensive admin panel for managing the restaurant's menu, orders, and content.

This project involved designing a normalised MySQL relational database, implementing a secure user authentication system, and building a modern frontend using Tailwind CSS and Vite for asset bundling.

Key Features

- Admin panel with full CRUD operations for menu management
- Secure authentication and role-based access control
- Normalised MySQL database design with Eloquent ORM
- Responsive frontend using Tailwind CSS



AI Order Automation · Systems Design Concept

- Integration design for third-party delivery platforms
- Staff dashboard for monitoring order statuses
- Data analytics module for identifying peak order times

PROFESSIONAL WORK

Work Experience Projects

Key systems and applications developed during my time at IT Arrow Pvt Ltd.

Enterprise Web Applications

Developed and maintained multiple client-facing web applications using PHP and MySQL, handling user management, data processing, and reporting features.

PHP MySQL JavaScript

Database Systems

Designed and optimised MySQL database schemas for multiple business applications, writing complex queries, stored procedures, and handling data migration tasks.

MySQL SQL

Schema Design

Deployment & Maintenance

Managed application deployment via cPanel hosting environments, performed regular maintenance, applied security patches, and monitored system performance.
